PROJECT

BetterDays

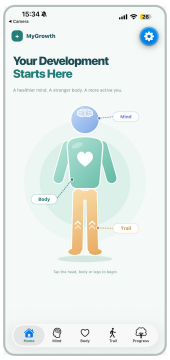

A mobile wellbeing companion for students and young adults · Lead Developer · 2026

`github.com/pskpsk009/BetterDays`

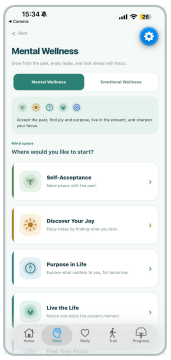

BetterDays turns small wellbeing habits into short, hands-on activities. Users tap the head, body, or legs of an interactive figure on the home screen to open **Mind**, **Body**, or the **Movement Trail**. Every activity is tap-, drag-, or sensor-driven rather than journal-style, and nothing is scored.

Expo SDK 57 · React Native · TypeScript · Expo Router · Reanimated · react-native-svg · expo-location · expo-sensors · react-native-maps · Supabase

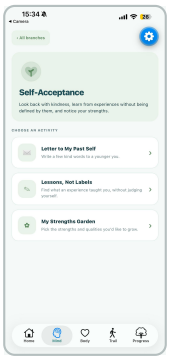

Home & Navigation

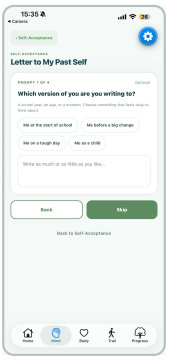

Home: interactive body figure

Mind tab: branch list

Inside a branch: Self-Acceptance

An activity: Letter to My Past Self

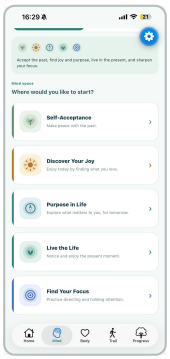

Home

- An **SVG body figure** with three tap zones: **Head** opens Mind, **Body** opens Body Functions, and **Legs** open the Movement Trail.
- Dashed callout labels point to each zone. Tapping one highlights it in its colour, dims the others, and shows a “Selected area” toast for a moment before opening that section.
- A softly **breathing halo** pulses behind the figure. It stays still when the phone’s reduce-motion setting is on.

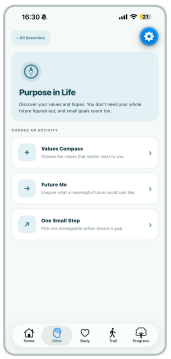

Navigation

- **Expo Router** with the phone’s own **native bottom tabs**: Home, Mind, Body, Trail, and Progress, with platform icons on iOS and Android.
- Mind and Body share one **branch explorer**: section overview → branch → activity, with a back button at each level. Mind adds a Mental/Emotional switch at the top.
- Every branch has its own colour and icon, which carry through to its activities so users always know where they are.

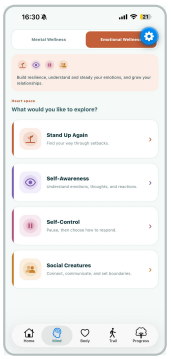

Mind: Mental & Emotional Wellness

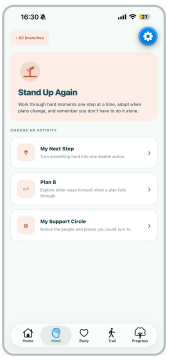

Mental Wellness overview

A Mental Wellness branch

Emotional Wellness overview

An Emotional Wellness branch

Mental Wellness

Grow from the past, enjoy today, look ahead with focus.

Past Self-Acceptance

Make peace with the past: lessons not labels, and a garden of your strengths.

Present Live the Life

Notice the moment with the Breathing Bubble, 5-Senses Grounding, and Watch Your Thoughts.

Today Discover Your Joy

Explore hobbies and pick one small, new thing to try today.

Future Purpose in Life

Choose your values and one manageable step toward a goal.

Every day Find Your Focus

Train attention with Focus Sprint and the Target Tap game.

Emotional Wellness

Understand your feelings, bounce back, connect with others.

Bounce back Stand Up Again

Turn a setback into one next step, and find a Plan B when plans fall through.

Understand Self-Awareness

Name a feeling with the Emotion Explorer and sort what you can and can't control.

Steady Self-Control

Stop, notice, breathe, then choose how to respond.

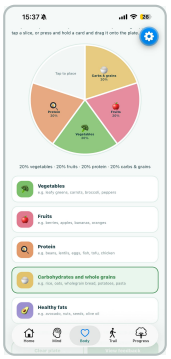

Connect Social Creatures

Practise conversation openers, other points of view, and kind boundaries.

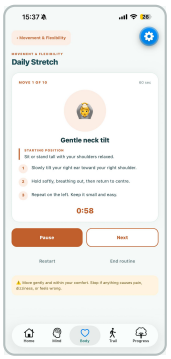

Body Functions

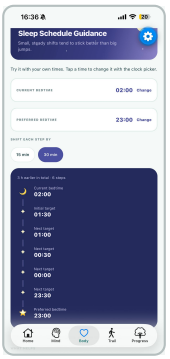

Hydration Check-in

Build a Balanced Plate

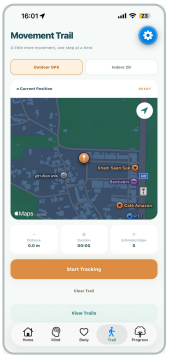

Daily Stretch

Sleep Schedule Guidance

- Fuel **Hydration Check-in**: tap a glass per drink, with an adjustable glass size (150–500 ml) and a daily target you set yourself (1–4 L).
- Fuel **Build a Balanced Plate**: long-press and drag food groups onto a five-slice SVG plate. The slice under your finger is found from its angle to the centre, and the feedback describes rather than judges.
- Movement **Daily Stretch** and **Desk Break**: guided move cards with countdown timers (3, 5, or 10-minute stretch routines) and a reminder to stop if anything hurts.
- Sleep **Sleep Schedule Guidance**: pick current and preferred bedtimes on a 24-hour picker and get a gradual night-by-night plan in 15 or 30-minute steps.

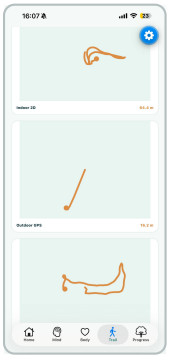

Movement Trail

Outdoor GPS trail

Indoor 2D drawing

View Trails gallery

- Outdoor Live GPS from `expo-location` drawn on `react-native-maps`, with haversine distance. Pause and resume start a new segment, so ground covered while paused isn't counted.
- Indoor For places without good GPS: accelerometer peaks detect steps and the magnetometer gives each step a direction. The path is drawn on an SVG canvas that scales to fit and smooths the line.
- View Trails Stopping offers *Save image* or *Discard*. Saved trails are uploaded as SVGs to Supabase Storage and appear in a shared gallery, newest first.

What I learned & next steps

- **Phone sensors are noisy.** Raw accelerometer data counts too many steps, so a step needs the signal to settle and a short gap first. Compass drift indoors is why the indoor trail is a drawing, not

a map.

- **Layout happens after first render.** SVG backgrounds sized in percentages didn't grow when text wrapped; measuring the real layout fixed overflowing headers.
- **Keep logic out of screens.** Timing, game rules, plate feedback, and sleep scheduling live in plain TypeScript modules, which made them easier to change.
- **Next:** background trail tracking, real saved progress (with consent, export, and deletion), automated tests for the logic modules, and moderation for the shared trails gallery.

MyGrowth is a prototype for everyday habit support. It does not diagnose, treat, or replace professional care.
